

Sales Performance Analysis

Final Report | Excel, SQL and Power BI | Sales data, January to December 2026

1. Dataset Overview

The retail company supplied 99 sales orders covering January to December 2026. Each record holds the order ID, order date, customer name, gender, product, category, quantity, unit price, city and salesperson. The data covers 6 products in 3 categories (Electronics, Furniture, Stationery), 6 cities (Accra, Kumasi, Abuja, Lome, Lagos and one unrecorded), 5 salespeople and 10 customers.

Total sales	Total orders	Average sale	Highest sale	Lowest sale
199,705	99	2,017	12,000	5

Amounts are in the currency units recorded in the dataset. The lowest sale ignores orders with zero sales (see section 2).

2. Data Cleaning Process

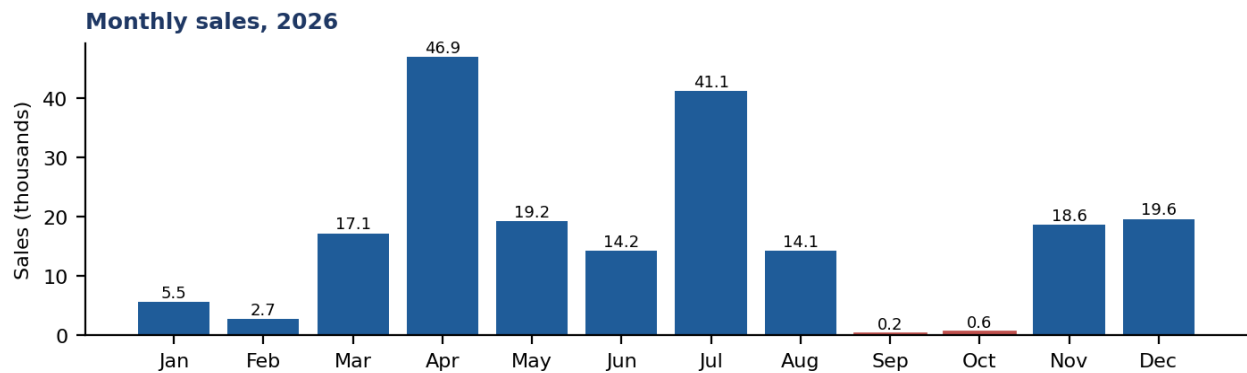

Cleaning was done in Excel and the same cleaned table was used in SQL Server and Power BI, so the three tools report the same figures.

Issue found	Action taken
Duplicate records	Checked every OrderID and every full row. No duplicates were found, so none were removed.
Missing or unrecognised values	Missing gender and city values were labelled "Unknown" (14 orders with unknown gender, 1 with unknown city). Order 83 had no valid unit price and was set to 0.
Inconsistent text	Names, gender, product, category, city and salesperson were standardised to proper case with spaces trimmed (for example "kumasi" and " Kumasi" became "Kumasi", "FEMALE" became "Female").
Order dates	One date stored as text was converted, and all dates are shown as dd/mm/yyyy.
New columns	TotalSales = Quantity x UnitPrice. Performance = IF(TotalSales >= 500, "High", "Low").
Zero-quantity orders	9 orders (9%) have quantity 0. They were kept in the 99-order count but add nothing to sales, and they are excluded from the lowest-sale figure.

Tools used. Excel: PROPER, TRIM, IF, SUM, AVERAGE, COUNT, MAX, MIN, three pivot tables and three charts. SQL: aggregate queries, GROUP BY, HAVING and ORDER BY. Power BI: Power Query, DAX measures (Total Sales, Average Sales, Total Orders) and an interactive dashboard with four slicers.

3. Key Findings

Question	Answer
Which category earns the most?	Electronics: 181,250 (90.8% of sales). Furniture: 18,115. Stationery: 340.
Which city has the highest sales?	Accra: 58,795 (29.4%), then Kumasi 47,855, Abuja 38,055, Lome 29,835 and Lagos 25,130.
Which product earns the most?	Laptop: 157,200 (78.7% of sales) from just 23 orders. The least-selling product is Notebook (340).
Do male or female customers spend more?	Female: 110,105 (55.1%) against Male: 79,230 (39.7%). Unknown gender: 10,370 (5.2%).
What is the sales trend?	Sales are uneven. They peak in April (46,915) , hold a smaller plateau through May to August (about 14,000–19,000 a month), collapse in September and October (740 combined), then recover to about 19,000 a month in November and December.

Bonus insights

- **Two salespeople drive most revenue.** Emeka (76,835) and Diana (65,420) together account for 71% of sales. Charles has the lowest total (9,075).
- **Half the orders produce almost all the sales.** The 50 orders rated High (500 or more) bring in 194,765, or 97.5% of revenue. The other 49 orders bring in only 4,940.
- **September and October are a serious gap.** These two months together earned 740, against an average of about 16,600 a month for the year.

4. Business Recommendations

- **Reduce dependence on laptops.** Nearly 80% of revenue rests on one product. Bundle printers, mice and desks with laptop orders to lift the smaller lines.
- **Plan for the September and October slump.** Investigate the cause (stock, seasonality or staffing) and run promotions or corporate offers in those months.
- **Grow beyond Accra and Kumasi.** These two cities give 53% of sales. Targeted campaigns in Lagos and Lome, the lowest-earning cities, could balance this.
- **Market to female customers** who generate over half of sales, and record gender consistently so the 14% of unknown records shrink.
- **Share sales practices.** Have Emeka and Diana coach the rest of the team, especially on high-value laptop deals.
- **Improve data entry.** Add checks for zero quantities, missing prices and city spelling, so problems are caught at the source rather than during cleaning.

5. Dashboard Screenshot

The Power BI dashboard summarises the analysis with KPI cards for total sales, total orders and average sales, plus sales by category, sales by gender, a city map, a product table and a time trend. Slicers for city, category, gender and product let the reader filter every visual.
